

Managed  
Planet™  
Control Your Jungle

**Software Store** is a convenient way to install software on client computers. Software Store allows you to give your users several methods where they can invoke advertised application or OS installations based on security credentials. These methods include a web portal, a SS application launch pad, and the 'all programs' start menu. With the install on demand technology you can provide the user the comfort and appearance of the application being ready for use.

**Managed Planet's** Software Store has greatly simplified application deployment for all LANDesk Management Suite users.

Enable IT staff to establish standardized libraries of authorized applications which are available to users on demand providing a consistent process and advance license control.

Visit our virtual Petting Zoo online. Instantly try and use the SS extension for LANDesk on demand.

## Software Store 9.0™

### Distribution Flexibility

- Software Store (SS) allows any type of script to be pulled, OS upgrades included.
- Software Store pulls are more successful because the user expects it.
- Software Store enables a user initiated application deployment process which is a more consistent, understandable and therefore successful experience, all with less effort from IT staff.

### Distribution Security

- SS jobs work even in an "administratively locked down" site with central IT control over application availability.
- Software Store uses LANDesk remote agent public key security.
- Software Store uses the access security built into Active Directory and LDAP query protocols.

### Distribution Economy

- Software Store saves the IT group time, and the company money.
- Utilizes LANDesk Bandwidth protection technologies including Peer Download, Targeted Multicasting and Bandwidth Throttling.
- Since Software Store only installs apps upon the users' first launch, licenses are preserved and more correctly apportioned across the company.
- You can use software packages you've already created, plus popular types like MSI packages.
