

Asset Control for LANDesk®

Get a birds-eye view
of your assets.

*New from
Managed Planet!*

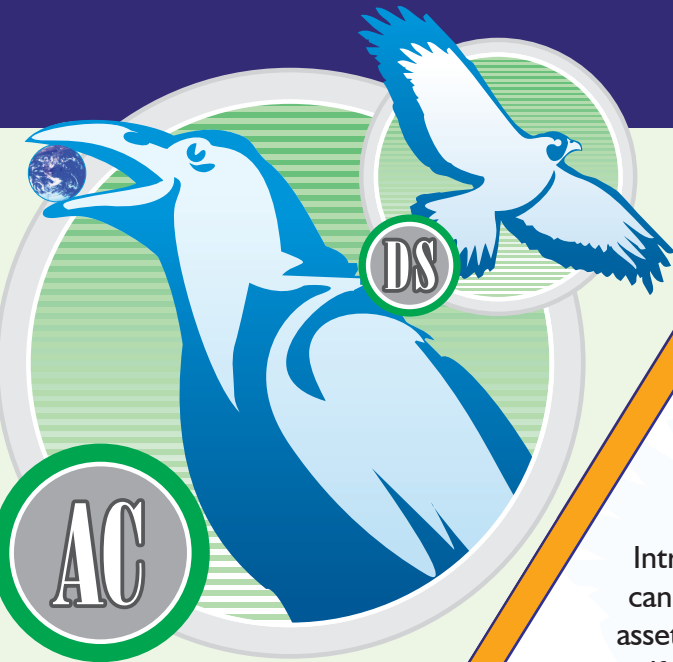

Soar to new heights by extending your
inventory with unmanaged asset data.

Introducing **Asset Control** for LANDesk®. With **Asset Control** you can now leverage your existing systems management investment for asset inventory control without the need to spend big and induce the windfall of managing a separate asset solution within your organization.

Asset Control can automate inventory of network attached devices such as - Printers, Copiers, Scanners, KVM's, Routers, Power Modules, Blade Cabinets, Barcode Scanners, Management Cards, and more! In addition **Asset Control** features include barcode automation or manual entry web form support to conduct inventory control of any asset that may not be attached. **Asset Control** also allows for easy delegation of responsibility to other business units in a controlled manner that conforms to your standards.

Asset Control enables you to find and distinguish all of your devices in the LANDesk® Management Suite Win32 console exactly like a managed device record. This provides virtually no learning curve to query or report on all of your business assets and keeps it all in one place to simplify **Asset Control**.

Behind **Asset Control** is our agentless **Discovery Services**. **Discovery Services** explores your network for attached devices as directed by your configuration and pulls in the value data attached to each asset. This data often includes the device configuration information in addition to the highly valued asset data utilized in business operations tracking.

Asset Control flies above the built-in unmanaged device detection by turning the obscure network discovery data into an entire asset management system.

The Managed Planet **Asset Control** extension for LANDesk® empowers you to not only detect other devices but also collect the device data and view it exactly like an inventory record.

Asset Control integrates directly into your win32 console providing you with the same query and reporting functionality you are familiar with.

Asset Control includes **Discovery Services** that automates the collection of network device data without the need for an agent.
